Hannah Brecht
Final Project Description

QuikPik

Overview

QuikPik is a mobile application that takes photos using your phone and saves them with a name of your choice. This allows you to document each photo you take and refer to them later. In addition, you will be able to search through your photos by name in order to find a specific image. This is a modern solution to documented photo albums of the past. You can easily remember what was going on in each of your photos.

Technology

The application will be a hybrid application that is built using the Ionic Framework. It will use the Cordova plugin to access the camera of the device. MongoDB will be the database used to store the title, date, and time of the image. Heroku will be used to deploy the application for users to access it. The IDE I will be using to create my application is Visual Studio Code.
